

FOREWORD

The present volume is Number Three of the series which will contain the scientific results of the deep-sea work carried out by the Galathea Expedition 1950-1952.

All results of studies on collections, etc. which were obtained either pelagically close to the surface or in shelf areas (down to a depth of some 400 m) will be published elsewhere. For reference a current list of such papers will be given in each new volume of the Galathea Reports. A full list of papers (up to 1958) was published in the Introduction to vol. 1 of the present series (1959, pp. 18-19).

The publication of a special Galathea Report has been made possible by a grant from Statens Almindelige Videnskabsfond (The Danish State Research Foundation). On behalf of the Galathea Committee, the Editors extend their warmest thanks to the Foundation for this support.
